Immediate loss by the static patch
100 V/m
50 V/m
Stable:
bounded orbit
and $\bar{t} > 1$ yr
$\bar{t} = 1$ yr
Loss by noise
in less than 1 yr
static patch field $|E|$ (V/m)
field noise at f_-, $S_E(f_-)$ (V^2 m^{-2} Hz^{-1})
surface noise at 4 K, scenarios A and B (bound)
three-stage filter + EMI, 4 K (at $|E| = 1$ V/m)
12 Hz filter + EMI, 4 K (at $|E| = 1$ V/m)
axial channel T2, 4 K (band: range of k and τ_z)
axial channel T2, worst case at 0.1 K
static-patch threshold: 50 V/m if sudden, 100 V/m if slow
